                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Parkinson's disease; amyotrophic lateral sclerosis; Huntington's disease; Hachenic heart disease; Guillain-Barre disease; alopecia; AIDS dementia; cerebral malaria; HTLV; neuropathy; inflammatory neurodegenerative disease; toxin induced liver disease.
                                                                                                                                                                                                                      Gaps
                                                          human saposin-C (AAR70784), promotes neurite outgrowth in vitro.
A consensus sequence was determined by comparing the peptide with hematopoietic and neuropoietic cytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary neurotrophic factor, interleukins-6, -2, -3 and gamma, erythropoietin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myelination ex vivo.
                                                The peptide given in AAR70773, corresponding to amino acids 8-29 of

prosaposin derived proline residues. Prosaposin, saposin C and prosaposin derived peptides (prosaptides), have therapeutic applications in promoting recovery after toxic, traumatic, myocardial ishchaemic, degenerative and inherited lesions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) inhibit proinfilammatory cytokine-induced apoptosis by activation of the Ser/Thr protein kinase Akt. Akt dissociates complexes of Bol-2 family members, such as BAD-Bol-2, releasing Bol-2 and its family members, such as BAD-Bol-2, releasing Bol-2 and its family members, such as BAD-Bol-2, releasing Bol-2 and its family members, such as BAD-Bol-2, releasing Bol-2 and its family members which inhibit caspases, thereby inhibiting apoptosis. An additional mechanism whereby PRAs inhibit apoptosis is by blocking activation of JNR by TWR alpha is another well known mechanism for activation of JNR by TWR alpha is another well known mechanism for activation of JNR by TWR alpha is another well known mechanism for TWR alpha-induced by tumor necrosis factor-alpha (TNF alpha). The ethod can be used for inhibiting apoptosis which is apoptosis as sociated with a disorder such as e.g. rhematoid carthritis, crohn's disease, intitable bowel syndrome, asthma, cardiac infarction, congestive heart failure, multiple sclerosis, acute disease, dillammatory leukcencephalitis, progressive multifocal eleukcencephalitis, Alzheimer's disease, Parkinson's disease, ischemic heart disease, Guillain-Barre disease, traumatic brain injury, traumatic spinal cord injury, alopecia, AIDS dementia, cerebral malaria, HTLV, celliver disease. Saposin C acts as a prosaposin receptor agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                    ö
                                                                                            co-factor for the lysosomal enzyme glucocerebrosidase, GCB. GCB is the enzyme involved in Gaucher's disease, a lysosomal storage disease. The invention relates to introducing new glycosylation sites into lysosomal enzymes/activators like GCB to improve their bioactivity. The novel polypeptides are used for the prevention and treatment of Gaucher's disease, Farber's disease, G_m_l gangliosidosis, Tay-Sach's disease, Niemann-Pick disease, Shindler disease, Hunter syndrome, Sly syndrome, Hurler and Huler/Scheie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polympeptide or polymucleotide sequence belonging to the perican, precursor of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a

degenerative, neurological and/or auto-immune disease. The polynuclectides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The peptide given in AAR70773, corresponding to amino acids 8-29 of human saposin-C (AAR70784), promotes neurite outgrowth in vitro. A consensus sequence was determined by comparing the peptide with hematopoletic and neuropoletic eytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neurotrophic factor, interleukins 6, -2, -3 and -gamma, erythropotetin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myelination ex vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Saposin-C; neuron; myelination; nervous system; neuroblastoma;

                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Prosaposin is a 70kDa glycoprotein which is proteclytically processed to generate saposins A, B, C and D, all of which are similar to each other and have a similar placement of six cysteines, a glycosylation of the and nave a similar placement of six cysteines, aglycosylation of site and conserved proline residues. Prosaposin, saposin C and posaposin derived peptides (prosaptides), have therapeutic and promoting recovery after toxic, traumatic, myocardial ishchaemic, degenerative and inherited lesions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) inhibit proinflammatory cytokine-induced apoptosis by activation of the Ser/Thr protein kinase Akt. Akt dissociates complexes of Bcl-2 canily members, such as BAD-Bcl-2, releasing Bcl-2 and its family members which inhibit caspases, thereby inhibiting apoptosis. An cadditional mechanism whereby PRAs inhibit apoptosis is by blocking activation of JNK, a proapoptotic signaling component. Within activation of JNK by Thr alpha is another well known mechanism for activation of JNK by Thr alpha is another well known mechanism for TNF alpha-induced, as well as other prolifiammatory cytokine-induced apoptosis. The method can be used for inhibiting apoptosis which is

caspase-mediated or induced by a proinflammatory cytokine, for example TNF alpha or interferon-gamma. It can be used for inhibiting appotosis associated with a disorder such as e.g. rheumatorial arthitis, Crohn's disease, Irritable bowel syndrome, asthma, cardiac discentinated inflammatory leukoencephalitis, progressive multifocal leukoencephalitis, Alzheimer's disease, Parkinson's disease, multifocal amyotrophic lateral sclerosis, Huntington's disease, ischemic heart disease, Guillain-Barre disease, traumatic brain injury, traumatic spinal cord injury, alopecia, AlDS dementia, cerebral malaria, HILV, neuropathy, inflammatory neurodegenerative disease, and toxin-induced liver disease. This 524 N-terminal peptide of prosaposin also acts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymorleotide sequence belonging to the perlecan, precursor of the retinol-bluding plasma protein, precursor of the families. The method is used for detecting, preventing or treating a families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymorleotides and polypeptides are used for diagnosis, prognosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand
has potent antianglogenic and antitumour activity, and also has antiproliferative and antimigratory activity against endothelial cells. This activity is conserved in cryptic polypeptides as small as 5 amino acids (see AA785684-715), which can be synthetically prepared and used in vitro or in vivo for the treatment of undesired anglogenesis and tumor growth, especially Kaposi's sarcome (claimed). The polypeptides can also be used in conjunction with cytotoxic moieties to selectively kill certain cell types, e.g. for treatment of cancer, angiofibroma, neovascular glaucoma, arteriovenous malformation, nonunion fracture, arthritis and other connective tissue disorders, Osler-Weber syndrome, atherosclerotic plaque, psoriasis, corneal graft neovascularization, pyogenic granuloma, retrolental fibroplasia, diabetic retinopathy.

prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisease sequences). They can also be used to assess efficacy of potential therapeutic agents particularly compounds that reduce or inhibit toxicity towards glial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Improved lysosomal enzymes and lysosomal enzyme activators useful for

```
The peptide given in AAR7073, corresponding to amino acids 8-29 of human saposin-C (AAR70784), promotes neurite outgrowth in vitro. A consensus sequence was determined by comparing the peptide with hematopoietic and neuropoietic gytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary neurotrophic factor, interleukins-6, -2, -3 and gamma, erythropoietin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myellnation ex vivo.
                                                                                                                                                                                                                                                                                                                    Saposin-C; neuron; myelination; nervous system; neuroblastoma; neurotrophic peptide; multiple sclerosis; leukoencephalitis;

                                                                       The sequence is a fusion protein of human lysosomal enzyme glucocerebrosidase, GGB and its Co-factor, Saponin C, SapC. GCB is the enzyme involved in Gaucher's disease, a lysosomal storage disease. The invention relates to introducing new glycosylation sites into lysosomal enzymes/activators like GCB to improve their bloactivity. The novel polypeptides are used for the prevention and treatment of Gaucher's disease, Fabry's disease, Fabry's disease, G_m_l gangliosidosis, Tay-Sach's disease, Niemann-Pick disease, Shindler disease, Hunter syndrome, Sly syndrome, Hurler and Huler/Scheie
                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to use of a prosaposin-related peptide or derivative, in the production of a medicament for use in preventing or delaying cell death, or in promoting the expression of cell death supporting gene product Bcl-XL. The invention is useful for preventing the death of cells e.g. brain cells, neurons and cardiac muscle cells, in vitro or ex vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of prosaposin-related peptides or derivatives as cytoprotective agents, for suppressing apoptosis or apoptosis-like cell death \,

                                                                                                                                                                                                                                                                                       The present sequence represents a prosaposin-derived peptide. A method has been developed of alleviating or preventing neuropathic pain in a subject, comprising administering an effective amount of an active fragment of prosaposin to the subject. The prosaposin-derived peptide is useful for therapy of neural or demyelination disorders in neural rissue. It can be used to stimulate neurite outgrowth, inhibit neural cell death, promote myelination or inhibit demyelination. The method is used to alleviate neuropathic pain resulting from a peripheral nerve disorder, such as neuroma, nerve compression, crush or stretch and incomplete nerve transsection, monoeuropathy or polyneuropathy.

Alternatively the neuropathic pain results from a disorder of the dorsal root ganglia, spinal cord, brainstem, thalamus or cortex.

The invention relates to prosaposin receptor agonists. Also claimed are: (1) methods for alleviating neuropathic pain or inhibiting the conset of neuropathic pain, comprising administering a prosaposin receptor agonist; (2) inhibiting sensory or motor neuropathy, comprising contacting neuronal cells with a composition comprising a prosaposin receptor agonist; (3) methods for stimulating neurits outgrowth, inhibiting neural cell death, promoting myelination, or inhibiting demyeliating on contacting neuronal cells with a composition comprising a prosaposin receptor agonist which has 14-50 amino acids and comprising a prosaposin receptor agonist which has 14-50 amino acids and comprising to a propasposin derived protein. The processes may be used for treatment of neuropathic pain resulting from peripheral nerve disorders (e.g. neuroma, nerve compression, nerve crush, nerve affects, incomplete nerve transsection, mononeuropathy or polyneuropathy) or disorders of dorsal root ganglia, the spinal cord, the brainstem, the thalamus or the cortex. The receptor agonists do not cause undesirable side effects. The present sequence represents a specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            irritable bowel syndrome; asthma; cardiac infarction; congestive heart failure; multiple sclerosis; acute disseminated inflammatory leukoencephalitis; progressive multifocal leukoencephalitis; Alzheimer's disease; parogressive multifocal leukoencephalitis; Alzheimer's disease; Huntington's disease; anyotrophic lateral sclerosis; Huntington's disease; ischemic heart disease; Guillain-Barre disease;

The present invention relates to use of a prosaposin-related peptide or derivative, in the production of a medicament for use in preventing or delaying cell death, or in promoting the expression of cell death supporting gene product Bcl-XL. The invention is useful for preventing the death of cells e.g. brain cells, neurons and cardiac muscle cells, in vitro or ex vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of prosaposin-related peptides or derivatives as cytoprotective agents, for suppressing apoptosis or apoptosis-like cell death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 28; 41pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                         Prosaposin is a 70kba glycoprotein which is proteolytically processed to generate saposins A, B, C and D, all of which are similar to each corper and have a similar placement of six cysteines, a glycosylation site and conserved proline residues. Prosaposin, saposin C and prosaposin derived peptides (prosaptides), have therapeutic applications in promoting recovery after toxic, traumatic, myccardial shchaemic, degenerative and inherited lesions to the peripheral and inhibit prolifiammatory cytokine-induced apoptosis by activation of the Ser/Thr protein kinase Akt. Akt dissociates complexes of Bcl-2 family members, such as BAD-Bcl-2, releasing Bcl-2 and its family members, such as BAD-Bcl-2, releasing Bcl-2 and its family members, such as BAD-Bcl-2, releasing bcl-2 and its family members after binding to the receptor. PRAS block JNK a proapoptotic signaling component. Within activation of JNK, a proapoptotic signaling component. Within several minutes after binding to the receptor, PRAS block JNK a ctivation induced by tumor necrosis factor-alpha (TNF alpha). The activation induced by tumor necrosis factor-alpha (TNF alpha). The cativation of JNK by TNF alpha is another well known mechanism for activation of JNK by TNF alpha is another well known mechanism for TNF alpha-induced, as well as other proinflammatory cytokine-induced apoptosis. The method can be used for inhibiting apoptosis which is caspase-mediated or induced by a proinflammatory cytokine-induced archivita, crohn's disease, irritable bowel sydicme, asthma, cardiac archivitis, Crohn's disease, irritable bowel sydicme, asthma, cardiac infarction, congestive heart fallure, multiple sclerosis, acute dissaminated inflammatory leukoencephalitis, progressive multifocal culsammatory leukoencephalitis, progressive multifocal casposic configured disease, traumatic barred disease, duillain-Barre disease, traumatic barred disease, duillammatory neurodegenerative disease, and toxin-induced cord injury, alopecia, Albs Gmentia, cerebral malaria, HTLV, neuropathy, i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Title: Characterization of a mutation in a family with saposin B deficiency: a glycosy A; Reference number: A35985; MUID:90207231; PMID:2320574
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A, Accession: 936989
A; Status: nucleic acid sequence not shown; translation not shown
A; Molecule type: mRNA
A; Molecule type: mRNA
A; Molecule type: mCNA
A; Molecule the nucleotide sequence was submitted to the EMBL Data Library, June 1991
A; Note: cerebroside sulfate activator protein mutant MU-0; corresponds to alternative
A; Accession: S36990
A; Status: nucleic acid sequence not shown; translation not shown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A;Note: saposin D

A Pastription: saposins bind sphingolipids, form hydrophilic complexes and make them A:Pathway: sphingolipid catabolism
A:Pathway: sphingolipid catabolism
A:Note: saposins A and C (SAD-1) activate hydrolysis of glucocerebroside by beta-gluc A:Note: saposin B (SAD-1) activates hydrolysis of galactocerebroside sulfate by arris A:Note: saposin D activates hydrolysis of sphingomyelin by sphingomyelin phosphodiest C:Superfamily: saposin repeat homology
C:Keywords: alternative splicing; glycoprotein; lysosomal storage disease; lysosome; F:1-16/Pomain: signal sequence fistus predicted <SIG>
F:17-557/Product: prosaposin #status predicted <PRO>
F:55-148/Domain: saposin A #status predicted <SAD>
F:60-143/Product: saposin Repeat homology <SAPA>
F:60-143/Product: saposin repeat homology <SAPA>

C.Species: Cavia porcellus (guinea pig)
C.Sacession: A32026
R.Sano, A.; Radin, N.S.; Johnson, L.L.; Tarr, G.E.
J. Biol. Chem. 263, 19597-19601, 1988
A.Title: The activator protein for glucosylceramide beta-glucosidase from guinea pig liv
A.Feference number: A32026
A.Accession: A32026
A.Accession: A32026
A.Accession: A32026
A.Roceule type: protein
A.Residues: 1-81 <SAN>
C.Superfamily: saposin; saposin repeat homology <SAP>

Cispecies: Cynara cardunculus (cardoon)
Cispecies: Gynara cardunculus (cardoon)
Cispecies: J3-Jan-1995 #sequence_revision 13-Jan-1995 #text_change 29-Aug-1997
Ciscossion: S47096

Aspartic proteinase (EC 3.4.23.-) - wild cabbage (fragment)

N.Alternate names: aspartyl protease
C;Species: Brassica oleracea (wild cabbage)
C;Date: (06-Jan-1995 #sequence_revision 06-Jan-1995 #text_change 29-Aug-1997
C;Accession: 841400
R;Fulikura, Y.; Karssen, C.M.
submitted to the EMBL Data Library, January 1994
A;Description: Cauliflower cDNA with sequence homology to gastric proteases.
A;Reference number: $41400
A;Reference number: $41400
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-322 <FUJJ-
A;Cross-references: EMBL:X77260
C;Comment: The pair of saposin repeat homology domains tagged SAP1 and SAP2 represent a
C;Superfamily: oryzasin; saposin repeat homology
C;Keywords: aspartic proteinase; hydrolase
C;Superfamily: apposin repeat homology #status atypical <SAP1>

by the sequential action of specific hydrolases. Some of these enzymes require specific low-molecular mass, non-enzymic proteins: the sphingolipids activator proteins (coproteins).

-I- FUNCTION: Saposin A and saposin C stimulate the hydrolysis of glucosylecramide by beta-glucosylecramidase (EC 3.2.145) and galactosylecramide by beta-glactosylecramidase (EC 3.2.146).

Saposin C apparently acts by combining with the enzyme and acidic lipid to form an activated complex, rather than by solubilizing

Saposin-C from bovine spleen; complete amino acid sequence and
relation between the structure and its biological activity.";
Electron. THE LYSOSOMAL DEGRADATION OF SPHINGOLIPIDS TAKES PLACE
BY THE SEQUENTIAL ACITION OF SPECIFIC HYDROLASES. SOME OF THESE
CRNZYMES REQUIRE SPECIFIC LOW-MOLECULAR MASS, NON-ENZYMIC PROTEINS:
THE SPHINGOLIPIDS ACTIVATOR PROTEINS (COPROTEINS) (BY SIMILARITY).
CHENCYLON: SAPOSIN A AND SAPOSIN C STIMULATE THE HYDROLYSIS OF
GLUCOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.45) AND
GLACTOSYLCERAMIDE BY BETA-GALACTOSYLCERAMIDASE (EC 3.2.1.46).
SAPOSIN-C APPARENTLY ACTS BY COMBINING WITH THE ENZYME AND ACIDIC
LIPLD TO FORM AN ACTIVATED COMPLEX, RATHER THAN BY SOLUBLIZING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EWBL outstation the European Bioinformatics Institute. There are no restrictions on its

Submitted (NOV-1998) to the EMBL/GenBank/DDBJ databases.

1. FUNCTION: THE LYSOSOMAL DESCRADATION OF SPHINGOLIPIDS TAKES PLACE
BY THE SEQUENTIAL ACTION OF SPECIFIC HYDROLASES. SOME OF THESE
ENZYMES REQUIRE SPECIFIC LOW-MOLECULAR MASS, NON-ENZYMIC PROTEINS:
THE SPHINGOLIPIDS ACTIVATOR PROTEINS (COPROTEINS) (BY SIMILARITY).

1. FUNCTION: SAPOSIN A AND SAPOSIN C STIMULATE THE HYDROLYSIS OF
GLUCOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.45) AND
GALACTOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.46).
SAPOSIN C APPARENTLY ACTS BY COMBINING WITH THE ENZYME AND ACIDIC
LIPID TO FORM AN ACTIVATED COMPLEX, RATHER THAN BY SOLUBILIZING
THE SUBSTRATE (BY SIMILARITY).

1. FUNCTION: SAPOSIN B STIMULATES THE HYDROLYSIS OF GALACTO-
                                               Sequence. F;
J. Biol. Chem. 263:19597-19601(1988).

J. Biol. Chem. 263:19597-19601(1988).

-i-FUNCTION: SAPOSIN A AND. SAPOSIN C STIMULATE THE HYDROLYSIS OF GLOCOSYLCERAMIDASE (EC 3.2.1.45) AND GALACTOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.46).

SAPOSIN-C APPARENTLY ACTS BY COMBINING WITH THE ENZYME AND ACIDIC LIPID TO FORM AN ACTIVATED COMPLEX, RATHER THAN BY SOLUBILIZING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-98129745; PubMed-9461526; Azuma N., Seo H.-C., Lie O., Fu Q., Gould R.M., Hiraiwa M., Burt D.W., Paton I.R., Morrice D.R., O'Brien J.S., Kishimoto Y.; Cloning, expression and map assignment of chicken prosaposin."; Biochem. Fatent No. 6271196

GENERAL INFORMATION:

APPLICANT: O'Brien, John S.

TITLE OF INVENTION: Methods of Alleviating Neuropathic Pain TITLE OF INVENTION: Using Prosaposin-Derived Peptides

NUMBER OF SEQUENCES: 21

CORRESPONDENCE ADDRESS:

ADDRESSEE: Campbell and Flores

STREET: 4370 La Jolla Village Drive, Suite 700

CITY: San Diego

STATE: Callfornia

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 15
